

# Screen Sleep App

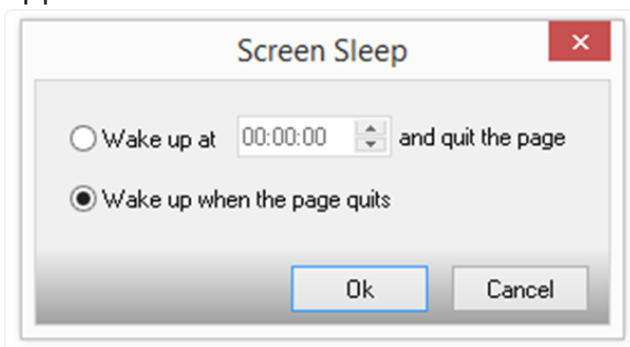

## Purpose

This page app allows you to save power by switching off the display attached to the computer. The app can be configured to switch the display back on at a specific time.

This app is normally placed in a playlist and scheduled to play at the time you want the screen to switch off for. At the same time the rest of the playlist is scheduled to not play during this time meaning this is triggered instantly.

## Configuration

Use this dialog to tell the app to switch the screen back on at a specific time or when the page times out and the app is closed.

If you specify that that the screen is switched back on at a specific time then the app sends messages to Acquire to keep the page from timing out until that event occurs.
