

Video Chooser App

Introduction.

This app is part of the Video Bundle which contains 5 different video functions to successfully capture, record and upload video files captured through a connected webcam or video recorder. The bundle also includes a file manager so that files are stored and managed within the Acquire Log files and a video playback manager. This is a comprehensive app that provides complete control over the video media files allowing you to make adjustments and change settings to the brightness, hue, contrast and saturation and audio levels. We have also developed a unique video clipping tool to provide a level of editing. Videos can be clipped so that specified sections of videos are played back. With advanced functionality the app can also perform intelligent actions such as jumping to another page, or quitting a page once the video as finished playing providing you with complete control of video content.

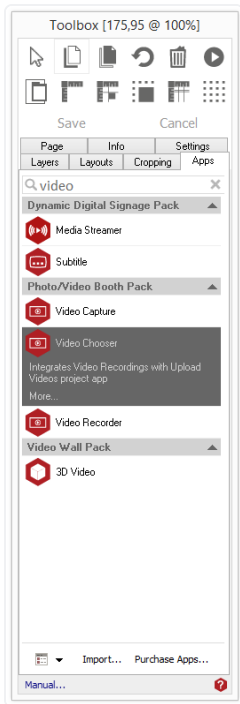

Uses.

This page app is used to control the [Upload Videos project app](#). It allows you to specify what files should be uploaded and what files should be deleted. This is typically used after a file has been recorded with the [Video Recorder page app](#) although there is no reason why it cannot be used for other files.

Using Video Chooser app.

To access the app open an existing or new page and select the **'App'** tab of the page editor **'Toolbox'** (shown below). Apps are grouped within the relevant app packs and are displayed red if they have been licensed. For more information about licencing apps go to [Licencing apps](#).

Select the app from the list or search for it using the search bar. When an app is selected it will be highlighted as shown.

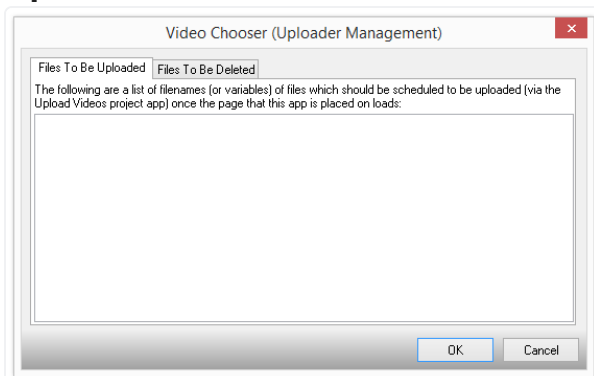

Once you have selected your app draw an area on your page where you would like to use the app. In this case you will be drawing a space where you want your button included on your page.

The **'Settings'** tab within the Toolbox will automatically open when the app is added to the page. From here you can set your app up by clicking on the **'App Options'** button.

Options.

- **The Files to be Uploaded tab:** list the name (full path) of files that should be uploaded to an FTP server via the UploadVideos project plug-in. This list may also contain variables, which is useful if the filenames are dynamically generated.
- **The Files to be Deleted tab:** can be useful to delete files that were not required to be uploaded to an FTP server.
